

Intro to Java Development

CSCI 4448/5448: Object-Oriented Analysis & Design

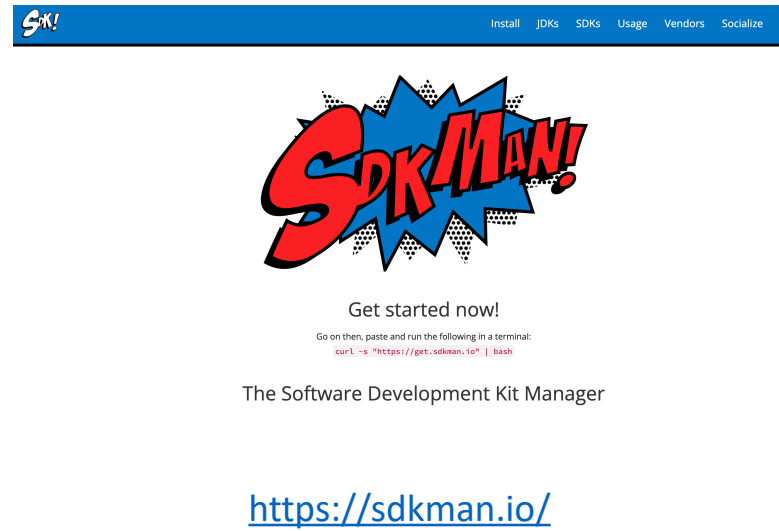

Goals of the Lecture

- Getting Java development tools installed
- Explaining the flow of development
- Building and testing

Installing and Managing Java Versions

- Use Java version 23
- jenv
- sdkman

Installing Java

> sdk list java

Available Java Versions for macOS ARM 64bit					
Vendor	Use	Version	Dist	Status	Identifier
Corretto		21.0.2	amzn		21.0.2-amzn
		21.0.1	amzn		21.0.1-amzn
		17.0.10	amzn		17.0.10-amzn
		17.0.9	amzn		17.0.9-amzn
		11.0.22	amzn		11.0.22-amzn
		11.0.21	amzn		11.0.21-amzn
		8.0.402	amzn		8.0.402-amzn
Gluon		8.0.392	amzn		8.0.392-amzn
		22.1.0.1.r17	gln		22.1.0.1.r17-gln
		22.1.0.1.r11	gln		22.1.0.1.r11-gln
GraalVM CE		21.0.2	graalce		21.0.2-graalce
		21.0.1	graalce		21.0.1-graalce
GraalVM Oracle		17.0.9	graalce		17.0.9-graalce

```

```
Installing: gradle 8.5
Done installing!
```

```
Do you want gradle 8.5 to be set as default? (Y/n): Y
```

```
Setting gradle 8.5 as default.
```

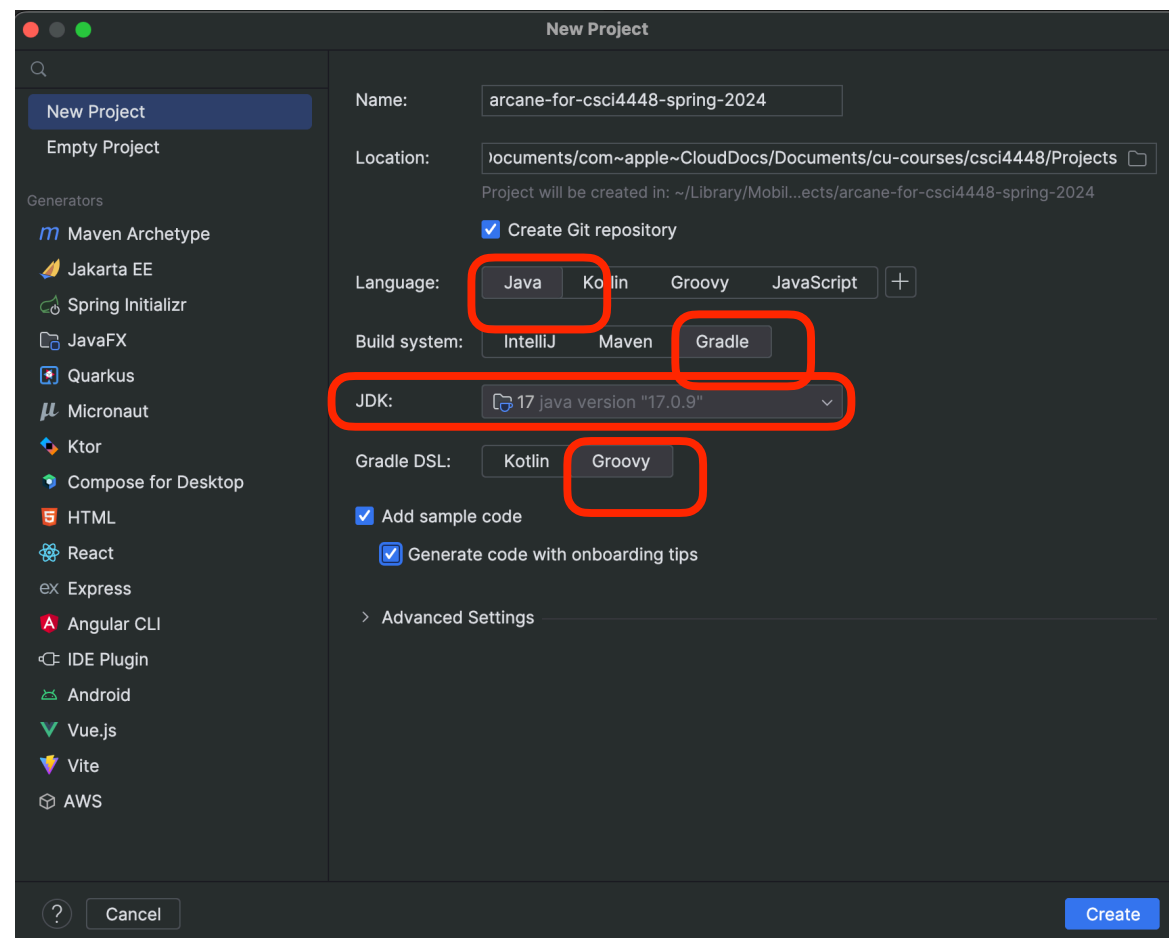

Use IntelliJ

- Everything else is ~~not~~ not as good
- Good to know command line as well
- Learn the debugger
- Setup it to work with GitHub — ssh key

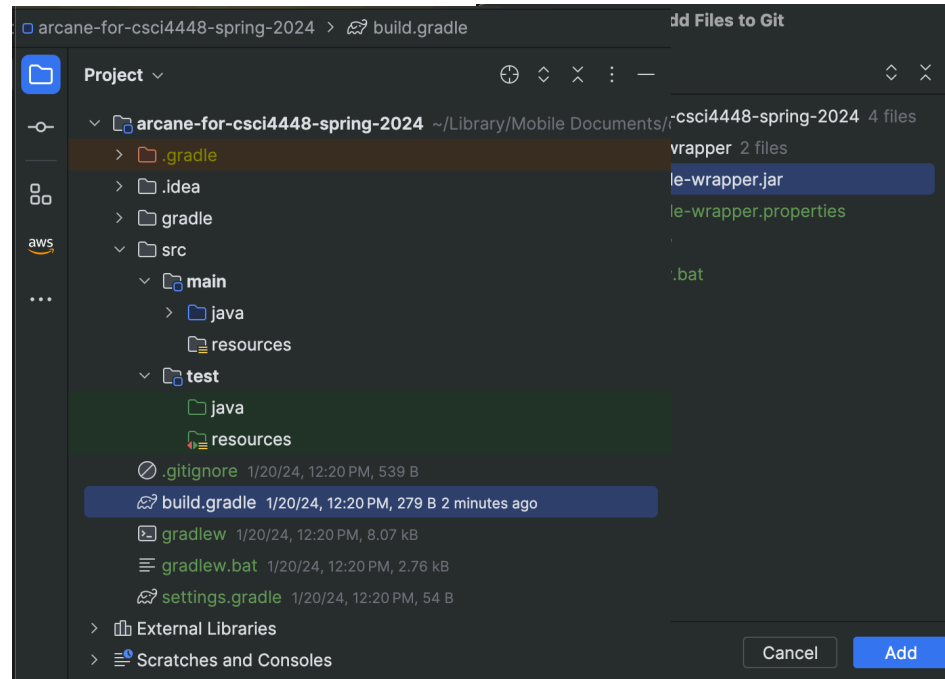

6

The most important part of your development environment is your debugger. Make sure you know how to use it.

Project Structure

Directory structure here is required, as gradle assumes this structure. Gradle uses a philosophy of “convention over configuration”

These wrapper files and executable files allow another teammate to download the project and build it, even if they don’t have gradle installed, as this will install it.

build.gradle

```
plugins {  
    id 'java'  
}  
  
java {  
    sourceCompatibility = '17'  
}  
  
group = 'csci.arcane'  
version = '1.0.0-SNAPSHOT'  
  
repositories {  
    mavenCentral()  
}  
  
dependencies {  
    testImplementation platform('org.junit:junit-bom:5.9.1')  
    testImplementation 'org.junit.jupiter:junit-jupiter'  
}  
  
test {  
    useJUnitPlatform()  
}
```

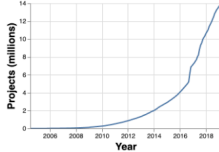

The platform() function is used to declare a dependency on a platform. A platform is a special kind of software component that doesn't contain any sources: it is only used to reference other libraries, so that they play well together during dependency resolution.
